Preface

Our Mission is to detect High Pressure in Cabin
There's a sensor to measure the pressure in the cabin and if the sensor detected a high pressure than normal it sends a signal to an existing Alarm then the Alarm makes a led to turn on for a while (not a constant Period).
In this Project many tools were used

1. Case Study

Our Client Needs to detect if there's a high pressure- (20 bar) in the cabin to protect the crew by alarming them by turning on a led for 60 seconds the sensor also sends the measured pressure signal every 30 seconds to store it in an external memory this is an optional feature.

- Assumptions

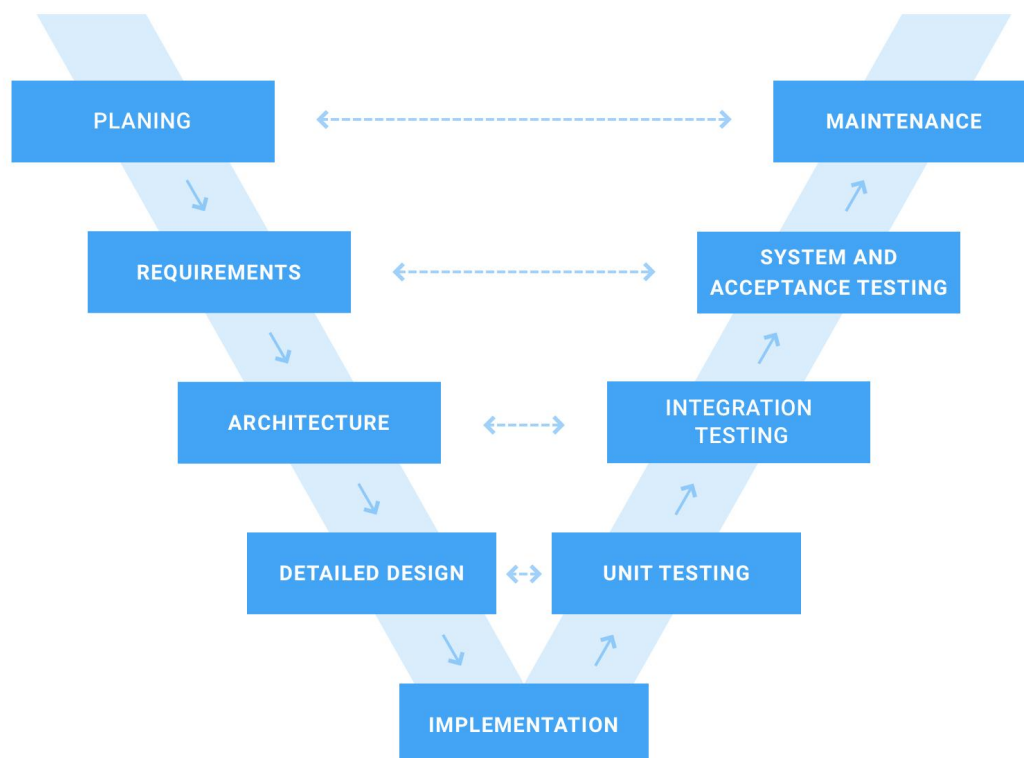

- 1 - Real time pressure detecting
- 2- Real time alarming
- 3- Sensors must not fail
- 4- External power to avoid failing

2. Method

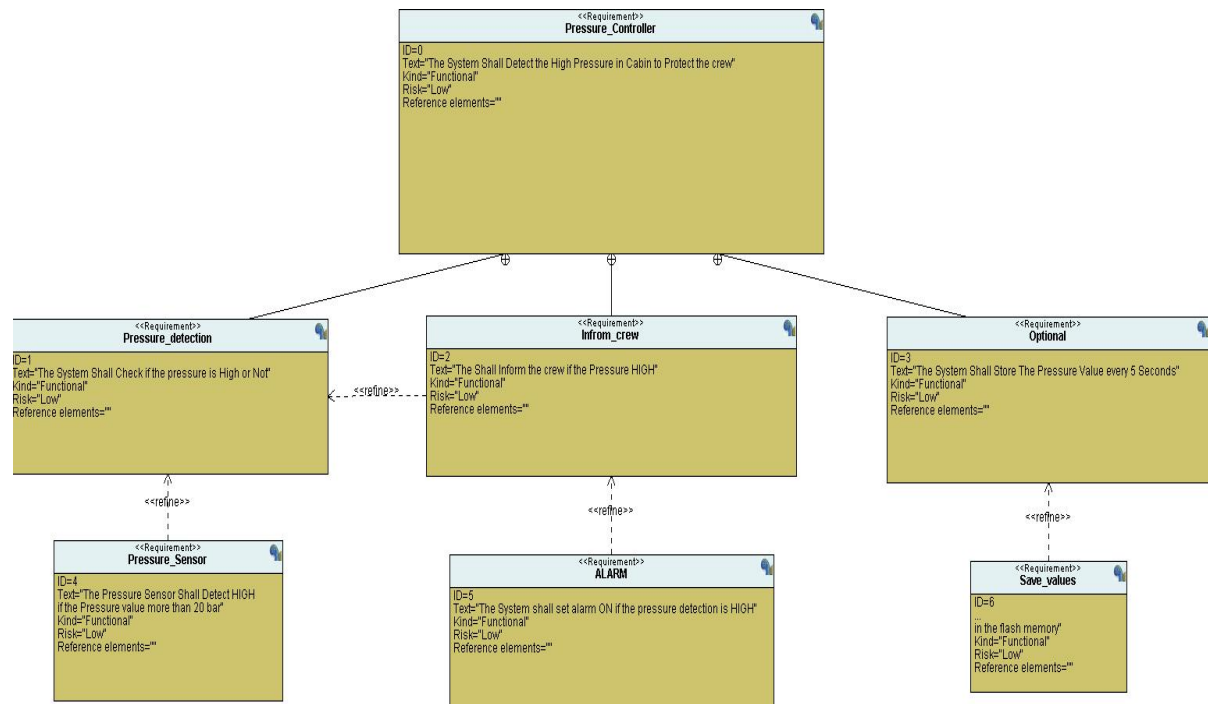

V-model is used in this Project

The V-model is a type of SDLC model in which processes are executed sequentially in a V-shape. It is also referred to as the Verification and Validation model. It is based on the assessment of a testing phase to each development stage. Each step's development is directly related to the testing phase. The next phase begins only after the previous phase has been completed.

V-Model

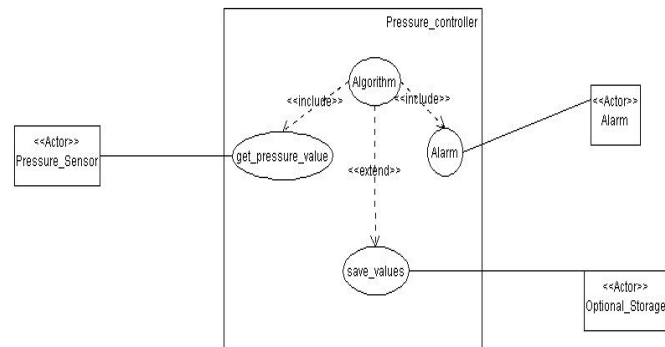

3. Requirements

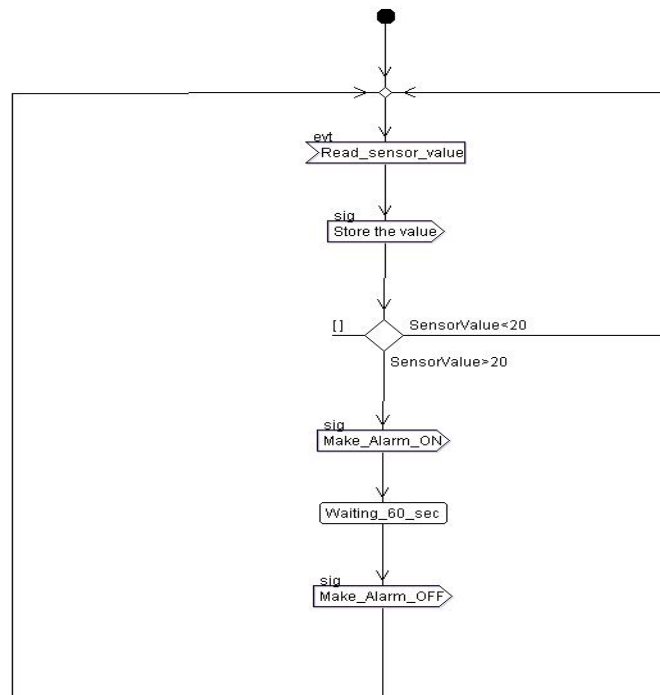

4. System Analysis

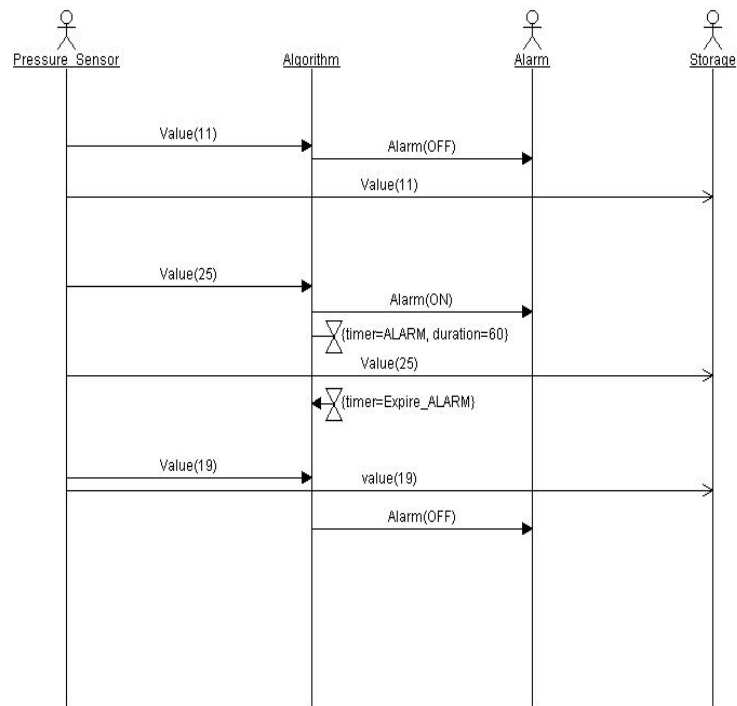

4.1 - use case Diagram

4.2- Activity Diagram

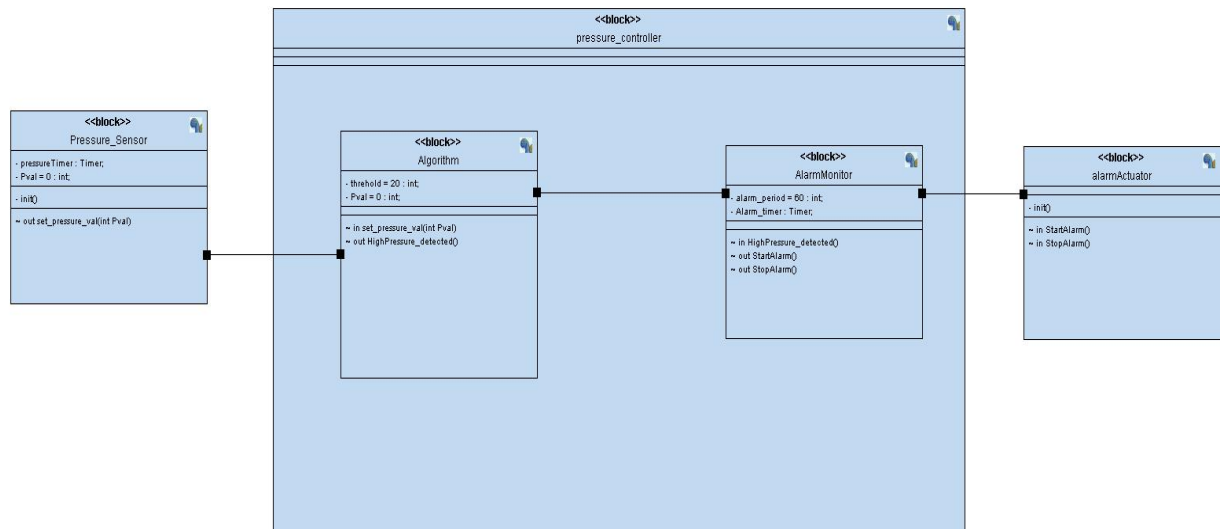

4.3- Sequence Diagram

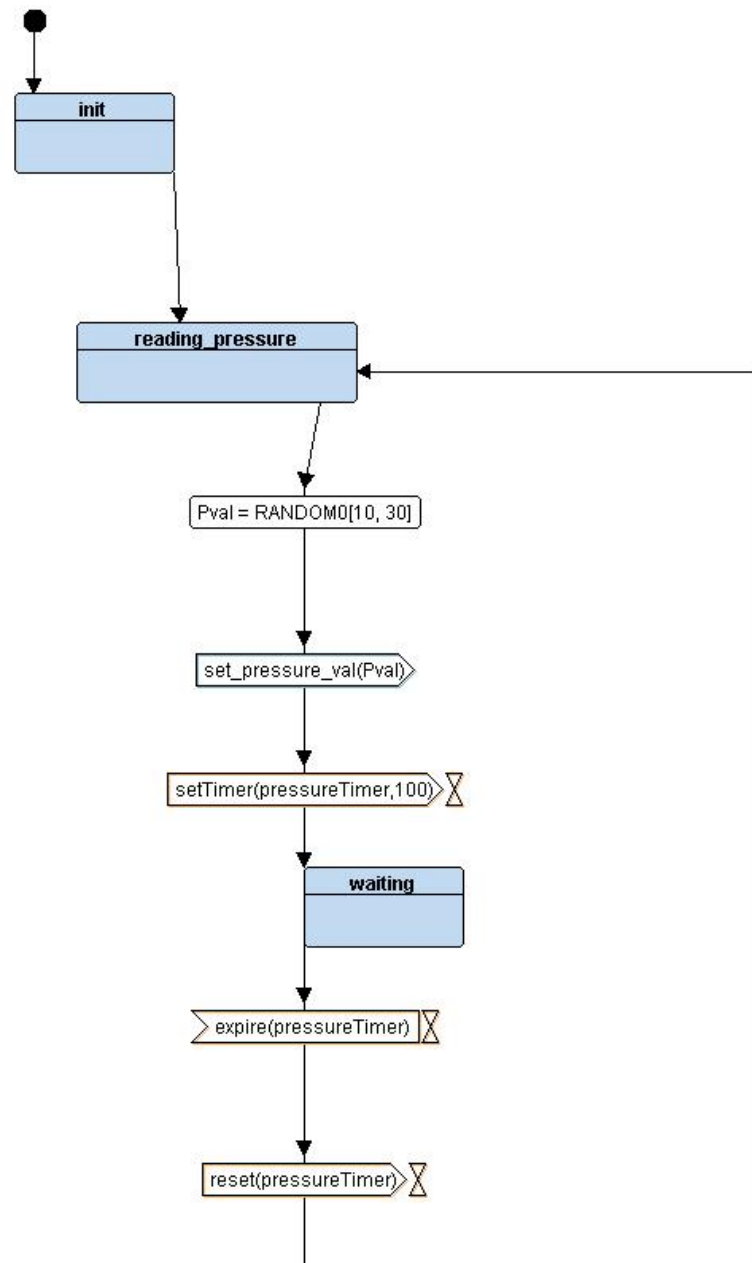

5- System Design

5.1 Block diagram

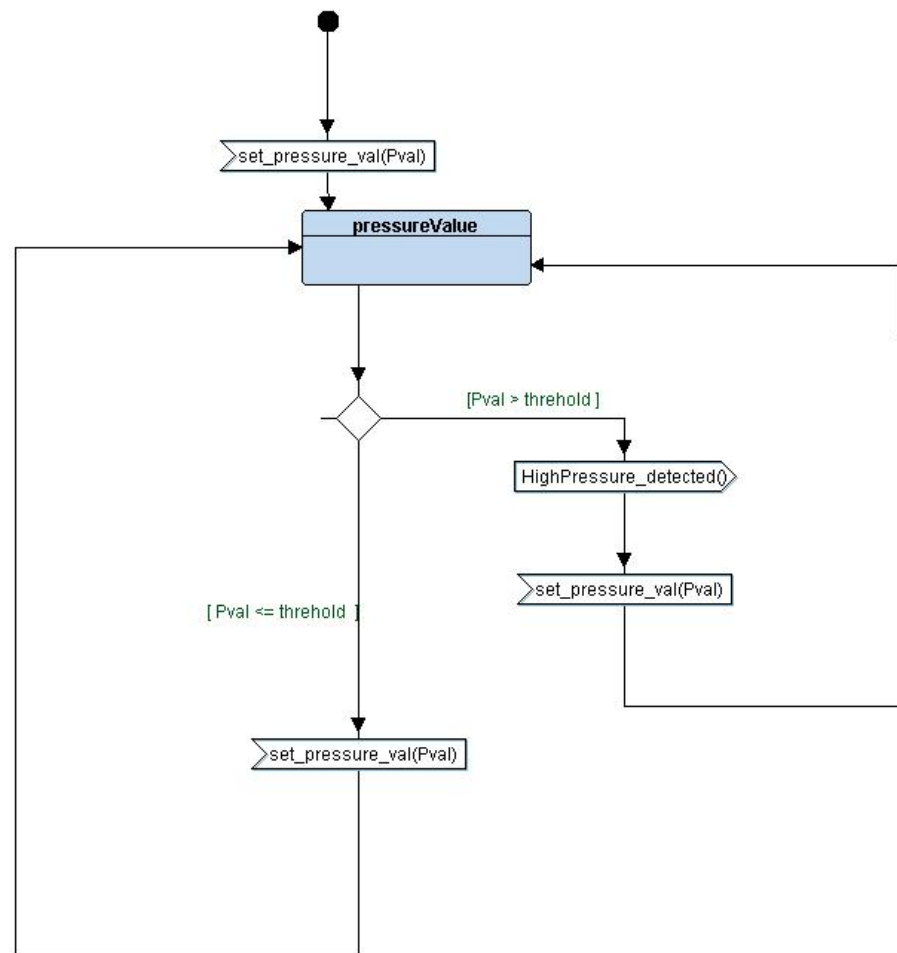

5.2 State Machine

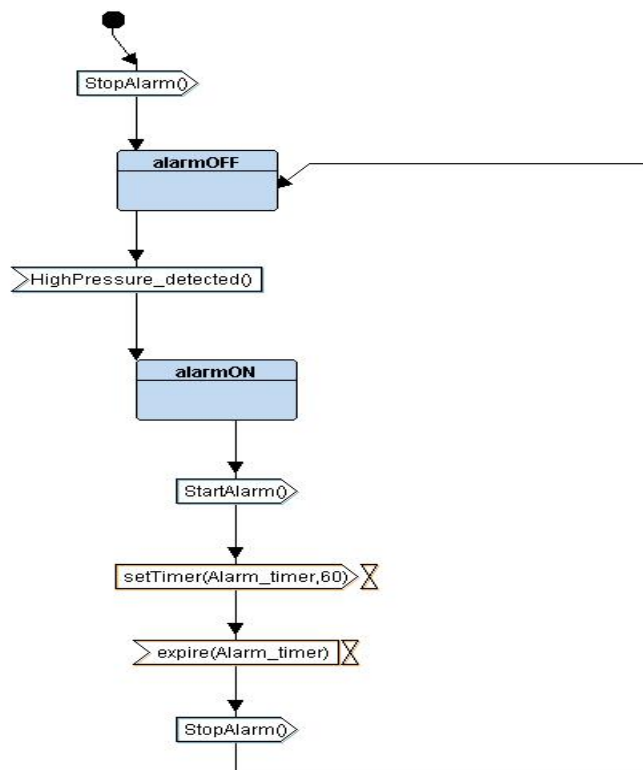

5.2.1 Pressure Sensor

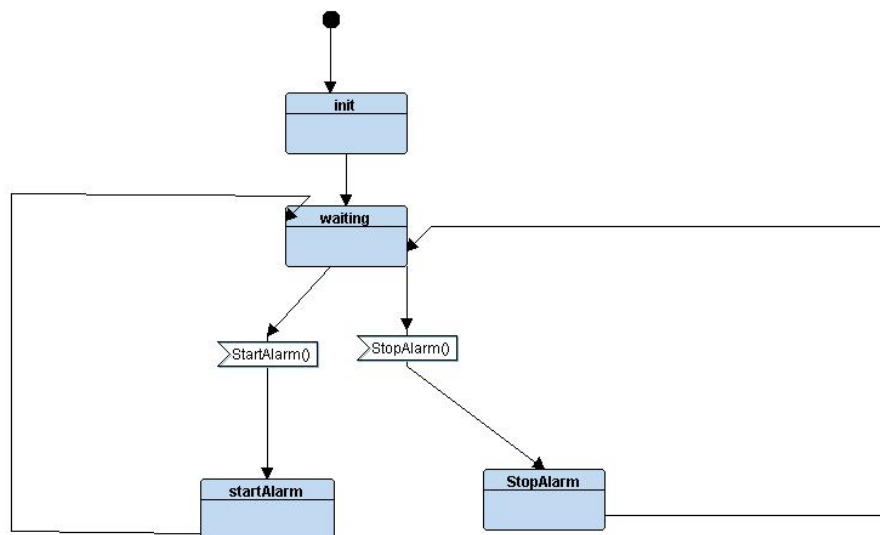

5.2.2 Main Algorithm

5.2.3 Alarm Monitor

5.2.4 Alarm Actuator

6- Software Analysis

6.1 arm compiler using our makefile

```
mingw32@LAPTOP-AFK5RJT4 MINGW32 /d/Coruses/Embedded/Course_kerolies/Project_1/SRC
